Allowed Domains ☒ Allow all domains

*

Prevent third-parties from using your Client ID by restricting access to allowed domains. Highly recommended for frontend applications.

- Authorize all domains with *
- Example: *.thirdweb.com accepts all .thirdweb.com sites
- Authorize local URLs with localhost:<port>
- Separate domains by commas or new lines

The screenshot shows a web application interface for managing contracts. On the left is a dark sidebar with a navigation menu. The main content area has a header with the title 'Contracts' and a subtitle 'Deploy and manage contracts for your project'. There are two buttons in the top right: 'Import contract' and '+ Deploy contract'. Below the header, there are two tabs: 'Contracts' (active) and 'Webhooks'. A table with five columns (NAME, TYPE, NETWORK, CONTRACT ADDRESS, ACTIONS) is shown, but it is empty. A message 'No contracts found' is displayed in the center of the table, with a button 'Discover Contracts' below it. The sidebar menu includes sections like 'Overview', 'Build', 'Monetize', 'Scale', and 'Project Settings', with 'Contracts' currently selected.
